## 1. General description

The GD32F130xx device belongs to the value line of GD32 MCU family. It is a 32-bit general-purpose microcontroller based on the high performance Arm® Cortex®-M3 RISC core with best ratio in terms of processing power, reduced power consumption and peripheral set. The Cortex®-M3 is a next generation processor core which is tightly coupled with a Nested Vectored Interrupt Controller (NVIC), SysTick timer and advanced debug support.

The GD32F130xx device incorporates the Arm® Cortex®-M3 32-bit processor core operating at 48 MHz frequency with Flash accesses zero wait states to obtain maximum efficiency. It provides up to 64 KB on-chip Flash memory and up to 8 KB SRAM memory. An extensive range of enhanced I/Os and peripherals connected to two APB buses. The devices offer one 12-bit ADC, up to five general 16-bit timers, a general 32-bit timer, a PWM advanced timer, as well as standard and advanced communication interfaces: up to two SPIs, two I2Cs and two USARTs.

The device operates from a 2.6 to 3.6 V power supply and available in –40 to +85 °C temperature range. Several power saving modes provide the flexibility for maximum optimization between wakeup latency and power consumption, an especially important consideration in low power applications.

The above features make the GD32F130xx devices suitable for a wide range of applications, especially in areas such as industrial control, motor drives, user interface, power monitor and alarm systems, consumer and handheld equipment, gaming and GPS, E-bike and so on.

## 3. Functional description

### 3.1. Arm® Cortex®-M3 core

The Cortex®-M3 processor is the latest generation of Arm® processors for embedded systems. It has been developed to provide a low-cost platform that meets the needs of MCU implementation, with a reduced pin count and low-power consumption, while delivering outstanding computational performance and an advanced system response to interrupts.

- 32-bit Arm® Cortex®-M3 processor core
- Up to 48 MHz operation frequency
- Single-cycle multiplication and hardware divider
- Integrated Nested Vectored Interrupt Controller (NVIC)
- 24-bit SysTick timer

The Cortex®-M3 processor is based on the Armv7 architecture and supports both Thumb and Thumb-2 instruction sets. Some system peripherals listed below are also provided by Cortex®-M3:

- Internal Bus Matrix connected with ICode bus, DCode bus, system bus, Private Peripheral Bus (PPB) and debug accesses (AHB-AP)
- Nested Vectored Interrupt Controller (NVIC)
- Flash Patch and Breakpoint (FPB)
- Data Watchpoint and Trace (DWT)
- Instrument Trace Macrocell (ITM)
- Serial Wire JTAG Debug Port (SWJ-DP)
- Trace Port Interface Unit (TPIU)

### 3.2. On-chip memory

- Up to 64 Kbytes of Flash memory
- The region of the MCU executing instructions without waiting time is up to 32K bytes (in case that the Flash size equal to 16K or 32K, all memory is no waiting time). A long time delay when CPU fetches the instructions out of the range.
- Up to 8 Kbytes of SRAM with hardware parity checking

The Arm® Cortex®-M3 processor is structured in Harvard architecture which can use separate buses to fetch instructions and load/store data. 64 Kbytes of inner Flash at most, which includes code Flash and data Flash is available for storing programs and data, and there is no waiting time within code Flash area when CPU executes instructions. The [Table 2-2. GD32F130xx memory map](#) shows the memory map of the GD32F130xx series of devices, including code, SRAM, peripheral, and other pre-defined regions.

### 3.3. Clock, reset and supply management

- Internal 8 MHz factory-trimmed RC and external 4 to 32 MHz crystal oscillator
- Internal 40 KHz RC calibrated oscillator and external 32.768 KHz crystal oscillator
- Integrated system clock PLL
- 2.6 to 3.6 V application supply and I/Os
- Supply Supervisor: POR (Power On Reset), PDR (Power Down Reset), and low voltage detector (LVD)

The Clock Control Unit (CCU) provides a range of oscillator and clock functions. These include speed internal RC oscillator and external crystal oscillator, high speed and low speed two types. Several prescalers allow the frequency configuration of the AHB and two APB domains. The maximum frequency of the AHB and two APB domains is 48 MHz. See [Figure 2-8. GD32F130xx clock tree](#) for details on the clock tree.

GD32F1x0 Reset Control includes the control of three kinds of reset: power reset, system reset and backup domain reset. A system reset resets the processor core and peripheral IP components with the exception of the SW-DP controller and the Backup domain. Power-on reset (POR) and power-down reset (PDR) are always active, and ensures proper operation starting from 2.6 V and down to 1.8V. The device remains in reset mode when  $V_{DD}$  is below a specified threshold. The embedded low voltage detector (LVD) monitors the power supply, compares it to the voltage threshold and generates an interrupt as a warning message for leading the MCU into security.

Power supply schemes:

- $V_{DD}$  range: 2.6 to 3.6 V, external power supply for I/Os and the internal regulator. Provided externally through VDD pins.
- $V_{SSA}$ ,  $V_{DDA}$  range: 2.6 to 3.6 V, external analog power supplies for ADC, reset blocks, RCs and PLL.  $V_{DDA}$  and  $V_{SSA}$  must be connected to VDD and VSS, respectively.
- $V_{BAT}$  range: 1.8 to 3.6 V, power supply for RTC, external clock 32 KHz oscillator and backup registers (through power switch) when  $V_{DD}$  is not present.

### 3.4. Boot modes

At startup, boot pins are used to select one of three boot options:

- Boot from main Flash memory (default)
- Boot from system memory
- Boot from on-chip SRAM

In default condition, boot from main Flash memory is selected. The boot loader is located in the internal boot ROM memory (system memory). It is used to reprogram the Flash memory by using USART0 (PA9 and PA10) or USART1 (PA2 and PA3, PA14 and PA15).

### 3.5. Power saving modes

The MCU supports three kinds of power saving modes to achieve even lower power consumption. They are sleep mode, deep-sleep mode, and standby mode. These operating modes reduce the power consumption and allow the application to achieve the best balance between the CPU operating time, speed and power consumption.

- **Sleep mode**

In sleep mode, only the clock of CPU core is off. All peripherals continue to operate and any interrupt/event can wake up the system.

- **Deep-sleep mode**

In deep-sleep mode, all clocks in the 1.2V domain are off, and all of the high speed crystal oscillator (IRC8M, HXTAL) and PLL are disabled. Only the contents of SRAM and registers are retained. Any interrupt or wakeup event from EXTI lines can wake up the system from the deep-sleep mode including the 16 external lines, the RTC alarm, the LVD output, the RTC tamper and timestamp, the USART0 wakeup and the CEC wakeup. When exiting the deep-sleep mode, the IRC8M is selected as the system clock.

- **Standby mode**

In standby mode, the whole 1.2V domain is power off, the LDO is shut down, and all of IRC8M, HXTAL and PLL are disabled. The contents of SRAM and registers (except Backup registers) are lost. There are four wakeup sources for the standby mode, including the external reset from NRST pin, the RTC alarm, the FWDGT reset, and the rising edge on WKUP pin.

### 3.6. Analog to digital converter (ADC)

- 12-bit SAR ADC's conversion rate is up to 1 MSPS.
- Input voltage range:  $V_{SSA}$  to  $V_{DDA}$  (2.6 to 3.6 V).
- Temperature sensor.

One 12-bit 1 MSPS multi-channel ADCs are integrated in the device. It is a total of up to 16 multiplexed external channels, 1 channel for internal temperature sensor ( $V_{SENSE}$ ), 1 channel for internal reference voltage ( $V_{REFINT}$ ) and 1 channel for battery voltage ( $V_{BAT}$ ). The input voltage range is between  $V_{SSA}$  and  $V_{DDA}$ . An analog watchdog block can be used to detect the channels, which are required to remain within a specific threshold window. A configurable channel management block of analog inputs also can be used to perform conversions in single, continuous, scan or discontinuous mode to support more advanced use.

The ADC can be triggered from the events generated by the general timers (TIMERx, x=1,2,14) and the advanced timers (TIMER0) with internal connection. The temperature sensor can be used to generate a voltage that varies linearly with temperature. It is internally connected to the ADC\_IN16 input channel which is used to convert the sensor output voltage into a digital value. Each device is factory-calibrated to improve the accuracy and the calibration data are stored in the system memory area.

### 3.7. DMA

- 7 channel DMA controller
- Peripherals supported: Timers, ADC, SPIs, I2Cs, USARTs

The flexible general-purpose DMA controllers provide a hardware method of transferring data between peripherals and/or memory without intervention from the CPU, thereby freeing up bandwidth for other system functions. Three types of access method are supported: peripheral to memory, memory to peripheral, memory to memory.

Each channel is connected to fixed hardware DMA requests. The priorities of DMA channel requests are determined by software configuration and hardware channel number. Transfer size of source and destination are independent and configurable.

### 3.8. General-purpose inputs/outputs (GPIOs)

- Up to 55 fast GPIOs, all mappable on 16 external interrupt lines
- Analog input/output configurable
- Alternate function input/output configurable

There are up to 55 general purpose I/O pins (GPIO) in GD32F130xx, named PA0 ~ PA15 and PB0 ~ PB15, PC0 ~ PC15, PD2, PF0, PF1, PF4-PF7 to implement logic input/output functions. Each of the GPIO ports has related control and configuration registers to satisfy the requirements of specific applications. The external interrupts on the GPIO pins of the device have related control and configuration registers in the Interrupt/event controller (EXTI). The GPIO ports are pin-shared with other alternative functions (AFs) to obtain maximum flexibility on the package pins. Each of the GPIO pins can be configured by software as output (push-pull or open-drain), as input (with or without pull-up or pull-down) or as peripheral alternate function. Most of the GPIO pins are shared with digital or analog alternate functions. All GPIOs are high-current capable except for analog inputs.

### 3.9. Timers and PWM generation

- One 16-bit advanced timer (TIMER0), one 32-bit general timer (TIMER1) and five 16-bit general timers (TIMER2, TIMER13 ~ TIMER16)
- Up to 4 independent channels of PWM, output compare or input capture for each general timer and external trigger input
- 16-bit, motor control PWM advanced timer with programmable dead-time generation for output match
- Encoder interface controller with two inputs using quadrature decoder
- 24-bit SysTick timer down counter
- 2 watchdog timers (free watchdog timer and window watchdog timer)

The advanced timer (TIMER0) can be used as a three-phase PWM multiplexed on 6 channels.

It has complementary PWM outputs with programmable dead-time generation. It can also be used as a complete general timer. The 4 independent channels can be used for input capture, output compare, generation of PWM waveform (edge-aligned or center-aligned mode) and single pulse mode output. If configured as a general 16-bit timer, it has the same functions as the TIMEx timer. It can be synchronized with external signals or to interconnect with other general timers together which have the same architecture and features.

The general timer can be used for a variety of purposes including general time, input signal pulse width measurement or output waveform generation such as a single pulse generation or PWM output, up to 4 independent channels for input capture/output compare. TIMER1 is based on a 32-bit auto-reload up/downcounter and a 16-bit prescaler. TIMER2 is based on a 16-bit auto-reload up/downcounter and a 16-bit prescaler. TIMER13 ~ TIMER16 is based on a 16-bit auto-reload upcounter and a 16-bit prescaler. The general timer also supports an encoder interface with two inputs using quadrature decoder.

The GD32F130xx have two watchdog peripherals, free watchdog timer and window watchdog timer. They offer a combination of high safety level, flexibility of use and timing accuracy.

The free watchdog timer includes a 12-bit down-counting counter and an 8-bit prescaler, It is clocked from an independent 40 KHz internal RC and as it operates independently of the main clock, it can operate in deep-sleep and standby modes. It can be used either as a watchdog to reset the device when a problem occurs, or as a free-running timer for application timeout management.

The window watchdog timer is based on a 7-bit down counter that can be set as free-running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from the main clock. It has an early wake up interrupt capability and the counter can be frozen in debug mode.

The SysTick timer is dedicated for OS, but could also be used as a standard down counter. The features are shown below:

- A 24-bit down counter
- Auto reload capability
- Maskable system interrupt generation when the counter reaches 0
- Programmable clock source

### 3.10. Real time clock (RTC)

- Independent binary-coded decimal (BCD) format timer/counter with five 32-bit backup registers
- Calendar with subsecond, seconds, minutes, hours, week day, date, year and month automatically correction
- Alarm function with wake up from deep-sleep and standby mode capability
- On-the-fly correction for synchronization with master clock. Digital calibration with 1 ppm resolution for compensation of quartz crystal inaccuracy

The real time clock is an independent timer which provides a set of continuously running counters in backup registers to provide a real calendar function, and provides an alarm interrupt or an expected interrupt. It is not reset by a system or power reset, or when the device wakes up from standby mode. In the RTC unit, there are two prescalers used for implementing the calendar and other functions. One prescaler is a 7-bit asynchronous prescaler and the other is a 15-bit synchronous prescaler.

### 3.11. Inter-integrated circuit (I2C)

- Up to two I2Cs bus interfaces can support both master and slave mode with a frequency up to 400 KHz
- Provide arbitration function, optional PEC (packet error checking) generation and checking
- Supports 7-bit and 10-bit addressing mode and general call addressing mode

The I2C interface is an internal circuit allowing communication with an external I2C interface which is an industry standard two line serial interface used for connection to external hardware. These two serial lines are known as a serial data line (SDA) and a serial clock line (SCL). The I2C module provides transfer rate of up to 100 KHz in standard mode and up to 400 KHz in fast mode. The I2C module also has an arbitration detect function to prevent the situation where more than one master attempts to transmit data to the I2C bus at the same time. A CRC-8 calculator is also provided in I2C interface to perform packet error checking for I2C data.

### 3.12. Serial peripheral interface (SPI)

- Up to two SPIs interfaces with a frequency of up to 18 MHz
- Support both master and slave mode
- Hardware CRC calculation and transmit automatic CRC error checking

The SPI interface uses 4 pins, among which are the serial data input and output lines (MISO & MOSI), the clock line (SCK) and the slave select line (NSS). Both SPIs can be served by the DMA controller. The SPI interface may be used for a variety of purposes, including simplex synchronous transfers on two lines with a possible bidirectional data line or reliable communication using CRC checking.

### 3.13. Universal synchronous asynchronous receiver transmitter (USART)

- Up to two USARTs with operating speed up to 6 Mbit/s
- Supports both asynchronous and clocked synchronous serial communication modes
- IrDA SIR encoder and decoder support

- LIN break generation and detection
- ISO 7816-3 compliant smart card interface

The USART (USART0, USART1) are used to translate data between parallel and serial interfaces, provides a flexible full duplex data exchange using synchronous or asynchronous transfer. It is also commonly used for RS-232 standard communication. The USART includes a programmable baud rate generator which is capable of dividing the system clock to produce a dedicated clock for the USART transmitter and receiver. The USART also supports DMA function for high speed data communication.

### 3.14. Debug mode

- Serial wire JTAG debug port (SWJ-DP)

The Arm® SWJ-DP Interface is embedded and is a combined JTAG and serial wire debug port that enables either a serial wire debug or a JTAG probe to be connected to the target.

### 3.15. Package and operation temperature

- LQFP64 (GD32F130Rx), LQFP48 (GD32F130Cx), LQFP32 (GD32F130Kx), QFN32 (GD32F130Kx), QFN28 (GD32F130Gx) and TSSOP20 (GD32F130Fx)
- Operation temperature range: -40°C to +85°C (industrial level)

## 4. Electrical characteristics

### 4.1. Absolute maximum ratings

The maximum ratings are the limits to which the device can be subjected without permanently damaging the device. Note that the device is not guaranteed to operate properly over the maximum ratings. Exposure to the absolute maximum rating conditions for extended periods may affect device reliability.

**Table 4-1. Absolute maximum ratings<sup>(1)(4)</sup>**

(1) Guaranteed by design, not tested in production.

(2) All main power and ground pins should be connected to an external power source within the allowable range.

(3) V<sub>IN</sub> maximum value cannot exceed 5.5 V.

(4) It is recommended that V<sub>DD</sub> and V<sub>DDA</sub> are powered by the same source. The maximum difference between V<sub>DD</sub> and V<sub>DDA</sub> does not exceed 300 mV during power-up and operation.

### 4.2. Operating conditions characteristics

Symbol	Parameter	Conditions	Min	Typ	Max <sup>(1)</sup>	Unit
V <sub>DD</sub>	Supply voltage	—	2.6	3.3	3.6	V
V <sub>DDA</sub>	Analog supply voltage	Same as V <sub>DD</sub>	2.6	3.3	3.6	V
V <sub>BAT</sub>	Battery supply voltage	—	1.8 <sup>(2)</sup>	—	3.6	V

(1) Based on characterization, not tested in production.

(2) In the application which V<sub>BAT</sub> supply the backup domains, if the V<sub>BAT</sub> voltage drops below the minimum value,

when  $V_{DD}$  is powered on again, it is necessary to refresh the registers of backup domains and enable LXTAL again.

**Figure 4-1. Recommended power supply decoupling capacitors<sup>(1)</sup>**

(1) Based on characterization, not tested in production.

(2) Unless otherwise specified, all values given for T<sub>A</sub> = 25 °C and test result is mean value.

(3) When System Clock is less than 4 MHz, an external source is used, and the HXTAL bypass function is needed, no PLL.

(4) When System Clock is greater than 8 MHz, a crystal 8 MHz is used, and the HXTAL bypass function is closed, using PLL.

(5) When analog peripheral blocks such as ADCs, HXTAL, LXTAL, IRC8M, or IRC40K are ON, an additional power consumption should be considered.

(6) All GPIOs are configured as analog mode except standby mode.

## 5.7. Thermal characteristics

Thermal resistance is used to characterize the thermal performance of the package device, which is represented by the Greek letter “ $\theta$ ”. For semiconductor devices, thermal resistance represents the steady-state temperature rise of the chip junction due to the heat dissipated on the chip surface.

$\theta_{JA}$ : Thermal resistance, junction-to-ambient.

$\theta_{JB}$ : Thermal resistance, junction-to-board.

$\theta_{JC}$ : Thermal resistance, junction-to-case.

$\Psi_{JB}$ : Thermal characterization parameter, junction-to-board.

$\Psi_{JT}$ : Thermal characterization parameter, junction-to-top center.

$$\theta_{JA}=(T_J-T_A)/P_D \quad (5-1)$$

$$\theta_{JB}=(T_J-T_B)/P_D \quad (5-2)$$

$$\theta_{JC}=(T_J-T_C)/P_D \quad (5-3)$$

Where,  $T_J$  = Junction temperature.

$T_A$  = Ambient temperature

$T_B$  = Board temperature

$T_C$  = Case temperature which is monitoring on package surface

$P_D$  = Total power dissipation

$\theta_{JA}$  represents the resistance of the heat flows from the heating junction to ambient air. It is an indicator of package heat dissipation capability. Lower  $\theta_{JA}$  can be considerate as better overall thermal performance.  $\theta_{JA}$  is generally used to estimate junction temperature.

$\theta_{JB}$  is used to measure the heat flow resistance between the chip surface and the PCB board.

$\theta_{JC}$  represents the thermal resistance between the chip surface and the package top case.  $\theta_{JC}$  is mainly used to estimate the heat dissipation of the system (using heat sink or other heat dissipation methods outside the device package).

## 7. Revision history

**Table 7-1. Revision history**

Revision No.	Description	Date
1.0	1. Initial Release.	Mar.8, 2014
1.1	1. Characteristics values updated in <b><u>Table 4-3. Power consumption characteristics.</u></b>	Oct.20, 2014
2.0	1. Characteristics of QFN32 package added in <b><u>Table 2-3. GD32F130R8 LQFP64 pin definitions</u></b> and <b><u>Table 5-2. QFN package dimensions.</u></b>	Jan 15, 2015
2.1	1. Characteristics of TSSOP20 package added in <b><u>Table 2-1. GD32F130xx devices features and peripheral list.</u></b>	Apr 24, 2016
3.0	1. Adapt To New Name Convention.	Jan.24, 2018
3.1	1. Add LQFP32 Package.	Apr.24, 2018
3.2	1. Modify 72MHz system frequency to 42MHz.	Jul.25, 2019
3.3	1. Modify formats and descriptions.	Nov.21, 2019
3.4	1. Update <b><u>Table 2-1. GD32F130xx devices features and peripheral list</u></b> and <b><u>Figure 2-4. GD32F130Kx LQFP32 pinouts.</u></b> 2. Update <b><u>Table 4-3. Power consumption characteristics.</u></b>	Jun.16.2021
3.5	1. Update <b><u>Table 4-1. Absolute maximum ratings<sup>(1)(4)</sup>.</u></b> 2. Modify USART maximum communication speed from 9M to 6M. 3. Update electrical parameters in chapter <b><u>Electrical characteristics.</u></b>	Jul. 12. 2022
3.6	1. Add notes for <b><u>Table 4-2. DC operating conditions</u></b> and <b><u>Table 4-7. Power consumption characteristics<sup>(2)(3)(4)(5)(6)</sup></u></b> , and update <b><u>Table 4-7. Power consumption characteristics<sup>(2)(3)(4)(5)(6)</sup>.</u></b> 2. Update <b><u>Figure 4-5. I2C bus timing diagram.</u></b>	Sep. 27, 2022
3.7	1. Add the TR suffix after the Ordering information TSSOP20, QFN28	Mar. 13, 2023
3.8	1. Add notes :more details refer to AN108 GD32F3x0 Hardware Development Guide. 2. Add the pin definitions format requires that a new line be added to the pin definitions.	Jun15. 2023
3.9	1. Add specific ability description to backup domain IO driver current. 2. Convert all encapsulated POD plots to vector plots.	Dec.31, 2023
4.0	1. All pods add coplanarity information.	Jun.30, 2024
