## 1. General description

The GD32L235xx device belongs to the value line of GD32 MCU family. It is a new 32-bit general-purpose microcontroller based on the ARM® Cortex®-M23 core. The Cortex-M23 processor is an energy-efficient processor with a very low gate count. It is intended to be used for microcontroller and deeply embedded applications that require an area-optimized processor. The processor delivers high energy efficiency through a small but powerful instruction set and extensively optimized design, providing high-end processing hardware including a single-cycle multiplier and a 17-cycle divider.

The GD32L235xx device incorporates the ARM® Cortex®-M23 32-bit processor core operating at up to 64 MHz frequency with Flash accesses 0~3 wait states to obtain maximum efficiency. It provides up to 128 KB embedded Flash memory and up to 24 KB SRAM memory. An extensive range of enhanced I/Os and peripherals connected to two APB buses. The devices offer one 12-bit ADC, one DAC, two comparators, up to six general 16-bit timers, two basic timers, one advanced timer and two 16-bit low power timers, as well as standard and advanced communication interfaces: up to two SPIs, three I2Cs, two USARTs, two UARTs, an I2S, a CAN, an USB and two LPUARTs. Additional peripherals as segment LCD controller (SLCD), cryptographic acceleration unit (CAU) are included.

The device operates from a 1.71 to 3.63 V power supply and available in -40 to +85 °C temperature range for grade 6 devices, and -40°C to +105°C temperature range for grade 7 devices. Several power saving modes provide the flexibility for maximum optimization between wakeup latency and power consumption, an especially important consideration in low power applications.

The above features make the GD32L235xx devices suitable for a wide range of applications, especially in areas such as industrial control, motor drives, user interface, power monitor and alarm systems, consumer and handheld equipment, gaming and GPS, E-bike and so on.

## 2.5. Clock tree

Figure 2-10. GD32L235xx clock tree

**Note:**

The TIMERS are clocked by the clock divided from CK\_APB2 and CK\_APB1. The frequency of TIMERS clock is equal to CK\_APBx (APB prescaler is 1), twice the CK\_APBx (APB prescaler is not 1).

**Legend:**

- HXTAL: High speed crystal oscillator
- LXTAL: Low speed crystal oscillator
- IRC16M: Internal 16M RC oscillator
- IRC48M: Internal 48M RC oscillator
- IRC32K: Internal 32K RC oscillator

## 3. Functional description

### 3.1. Arm® Cortex®-M23 core

The Cortex-M23 processor is an energy-efficient processor with a very low gate count. It is intended to be used for microcontroller and deeply embedded applications that require an area-optimized processor. The processor is highly configurable enabling a wide range of implementations from those requiring memory protection and powerful trace technology to cost sensitive devices requiring minimal area, while delivering outstanding computational performance and an advanced system response to interrupts.

32-bit ARM® Cortex®-M23 processor core

- Up to 64 MHz operation frequency.
- Single-cycle multiplication and hardware divider.
- Ultra-low power, energy-efficient operation.
- Excellent code density.
- Integrated Nested Vectored Interrupt Controller (NVIC).
- 24-bit SysTick timer.

The Cortex®-M23 processor is based on the ARMv8-M architecture and supports both Thumb and Thumb-2 instruction sets. Some system peripherals listed below are also provided by Cortex®-M23:

- Internal Bus Matrix connected with AHB master, Serial Wire Debug Port and Single-cycle IO port.
- Nested Vectored Interrupt Controller (NVIC).
- Breakpoint Unit(BPU).
- Data Watchpoint and Trace (DWT).
- Serial Wire Debug Port.

### 3.2. Embedded memory

- Up to 128 Kbytes of Flash memory.
- Up to 24 Kbytes of SRAM with hardware parity checking.
- Flash ECC check supported.

128 Kbytes of inner Flash memory, and 24 Kbytes of inner SRAM at most is available for storing programs and data, and Flash is accessed (read) at CPU clock speed with 0~2 wait states. [Table 2-3. GD32L235xx memory map](#) shows the memory map of the GD32L235xx series of devices, including code, SRAM, peripheral, and other pre-defined regions.

### 3.3. Clock, reset and supply management

- Internal 16 MHz factory-trimmed RC and external 4 to 48 MHz crystal oscillator.
- Internal 48 MHz factory-trimmed RC.
- Internal 32 KHz RC calibrated oscillator and external 32.768 KHz crystal oscillator.
- Integrated system clock PLL.
- 1.71 to 3.63 V application supply and I/Os.
- Supply Supervisor: POR (Power On Reset), PDR (Power Down Reset), and low voltage detector (LVD).

The Clock Control Unit (CCTL) provides a range of oscillator and clock functions. These include speed internal RC oscillator and external crystal oscillator, high speed and low speed two types. Several prescalers allow the frequency configuration of the AHB and two APB domains. The maximum frequency of the AHB, APB2 and APB1 domains is 64 MHz/64 MHz/32 MHz. See [Figure 2-10. GD32L235xx clock tree](#) for details on the clock tree.

The Reset Control Unit (RCU) controls three kinds of reset: system reset resets the processor core and peripheral IP components. Power-on reset (POR) and power-down reset (PDR) are always active, and ensures proper operation starting from 1.56 V and down to 1.48V. The device remains in reset mode when  $V_{DD}$  is below a specified threshold. The embedded low voltage detector (LVD) monitors the power supply, compares it to the voltage threshold and generates an interrupt as a warning message for leading the MCU into security.

Power supply schemes:

- $V_{DD}$  range: 1.71 to 3.63 V, external power supply for I/Os and the internal regulator. Provided externally through  $V_{DD}$  pins.
- $V_{SS}$  is 0 V.
- $V_{DDA}$  range: 1.71 to 3.63 V, external analog power supplies for ADC, reset blocks, RCs and PLL.
- $V_{BAT}$  range: 1.71 to 3.63 V, power supply for RTC unit, LXTAL oscillator, BPOR, and two pads, including PC13 to PC15 when  $V_{DD}$  is not present.

### 3.4. Boot modes

At startup, boot pins are used to select one of three boot options:

- Boot from main Flash memory (default).
- Boot from system memory.
- Boot from on-chip SRAM.

In default condition, boot from main Flash memory is selected. The boot loader is located in the internal boot ROM memory (system memory). It is used to reprogram the Flash memory by using USART0 (PA9 and PA10) or USART1 (PA2 and PA3) or USBDM (PA11 and PA12).

### 3.5. Power saving modes

The MCU supports six kinds of power saving modes to achieve even lower power consumption. They are Run, Sleep, Deep-sleep, Deep-sleep 1, Deep-sleep 2 and Standby mode. These operating modes reduce the power consumption and allow the application to achieve the best balance between the CPU operating time, speed and power consumption.

#### ■ Run mode

After system reset/ power reset or wakeup from standby mode, the MCU enters Run mode. And the NPLDO (normal power LDO) works in 1.1V mode.

#### ■ Sleep mode

The Sleep mode is corresponding to the SLEEPING mode of the Cortex<sup>®</sup>-M23. In Sleep mode, only clock of Cortex<sup>®</sup>-M23 is off. To enter the Sleep mode, it is only necessary to clear the SLEEPDEEP bit in the Cortex<sup>®</sup>-M23 System Control Register, and execute a WFI or WFE instruction. If the Sleep mode is entered by executing a WFI instruction, any interrupt can wake up the system. If it is entered by executing a WFE instruction, any wakeup event can wake up the system (If SEVONPEND is 1, any interrupt can wake up the system, refer to Cortex<sup>®</sup>-M23 Technical Reference Manual). The mode offers the lowest wakeup time as no time is wasted in interrupt entry or exit.

#### ■ Deep-sleep mode

The Deep-sleep mode is based on the SLEEPDEEP mode of the Cortex<sup>®</sup>-M23. In Deep-sleep mode, all clocks in the 1.1V domain are off, and all of IRC16M, IRC48M, HXTAL and PLLs are disabled. The contents of SRAM and registers are preserved. The NPLDO can operate normally or in low driver mode depending on the LDNPDSP bit in the PMU\_CTL0 register. Before entering the Deep-sleep mode, it is necessary to set the SLEEPDEEP bit in the Cortex<sup>®</sup>-M23 System Control Register, and set LPMOD bits to “00” in the PMU\_CTL0 register. Then, the device enters the Deep-sleep mode after a WFI or WFE instruction is executed. If the Deep-sleep mode is entered by executing a WFI instruction, any interrupt from EXTI lines can wake up the system. If it is entered by executing a WFE instruction, any wakeup event from EXTI lines can wake up the system (If SEVONPEND is 1, any interrupt from EXTI lines can wake up the system, refer to Cortex<sup>®</sup>-M23 Technical Reference Manual). When exiting the Deep-sleep mode, the IRC16M is selected as the system clock. Notice that an additional wakeup delay will be incurred if the LDO operates in low driver mode.

#### ■ Deep-sleep 1 mode

The Deep-sleep 1 mode is based on the SLEEPDEEP mode of the Cortex<sup>®</sup>-M23. In Deep-sleep 1 mode, all clocks in the 1.1V domain are off, and all of IRC16M, IRC48M, HXTAL and PLLs are disabled. The LPLDO (low power LDO) can operate normally instead of NPLDO. Before entering the Deep-sleep 1 mode, it is necessary to set the SLEEPDEEP bit in the Cortex<sup>®</sup>-M23 System Control Register, set LPMOD bits to “01” in the PMU\_CTL0 register. Then, the device enters the Deep-sleep 1 mode after a WFI or WFE instruction is executed. If the Deep-sleep 1 mode is entered by executing a WFI instruction, any interrupt from EXTI lines can wake up the system. If it is entered by executing a WFE instruction, any wakeup event from EXTI lines can wake up the system

(If SEVONPEND is 1, any interrupt from EXTI lines can wake up the system, refer to Cortex®-M23 Technical Reference Manual). When exiting the Deep-sleep 1 mode, the IRC16M is selected as the system clock. Waking up from Deep-sleep 1 mode needs an additional delay to wakeup NPLDO.

■ **Deep-sleep 2 mode**

The Deep-sleep 2 mode is based on the SLEEPDEEP mode of the Cortex®-M23. In Deep-sleep 2 mode, all clocks in the 1.1V domain are off, and all of IRC16M, IRC48M, HXTAL and PLLs are disabled. The power of COREOFF0 / SRAM1 domain is cut off and the contents of COREOFF0 / SRAM1 domain are lost. The LPLDO can operate normally instead of NPLDO. Before entering the Deep-sleep 2 mode, it is necessary to set the SLEEPDEEP bit in the Cortex®-M23 System Control Register, set LPMOD bits to “10” in the PMU\_CTL0 register. Then, the device enters the Deep-sleep 2 mode after a WFI or WFE instruction is executed. If the Deep-sleep 2 mode is entered by executing a WFI instruction, any interrupt from EXTI lines can wake up the system. If it is entered by executing a WFE instruction, any wakeup event from EXTI lines can wake up the system (If SEVONPEND is 1, any interrupt from EXTI lines can wake up the system, refer to Cortex®-M23 Technical Reference Manual). When exiting the Deep-sleep 2 mode, the IRC16M is selected as the system clock. Waking up from Deep-sleep 2 mode needs an additional delay to wakeup NPLDO.

■ **Standby mode**

The Standby mode is based on the SLEEPDEEP mode of the Cortex®-M23 too. In Standby mode, the whole 1.1V domain is power off, the NPLDO / LPLDO is shut down, and all of IRC16M, IRC48M, HXTAL and PLLs are disabled. Before entering the Standby mode, it is necessary to set the LPMOD bits to “11” in the PMU\_CTL0 register, and clear WUF bit in the PMU\_CS register, and set the SLEEPDEEP bit in the Cortex®-M23 System Control Register. Then, the device enters the Standby mode after a WFI or WFE instruction is executed, and the STBF status flag in the PMU\_CS register indicates that the MCU has been in Standby mode. There are four wakeup sources for the Standby mode, including the external reset from NRST pin, the RTC alarm / time stamp / tamper / auto wakeup events, the FWDGT reset, and the rising edge on WKUP pins. The Standby mode achieves the lowest power consumption, but spends longest time to wake up. Besides, the contents of SRAM and registers in 1.1V power domain are lost in Standby mode. When exiting from the Standby mode, a power-on reset occurs and the Cortex®-M23 will execute instruction code from the 0x00000000 address.

### 3.6. Clock trim controller (CTC)

- Two external reference signal source: GPIO, LXTAL clock.
- Provide software reference sync pulse.
- Automatically trimmed by hardware without any software action.
- 16 bits trim counter with reference signal source capture and reload.
- 8 bits clock trim base value to frequency evaluation and automatically trim.

The Clock Trim Controller (CTC) is used to trim internal 48MHz RC oscillator (IRC48M) automatically by hardware. The CTC unit trim the frequency of the IRC48M based on an external accurate reference signal source. It can automatically adjust the trim value to provide a precise IRC48M clock.

### 3.7. General-purpose inputs/outputs (GPIOs)

- Up to 59 fast GPIOs, all mappable on 16 external interrupt lines.
- Analog input/output configurable.
- Alternate function input/output configurable.

There are up to 59 general purpose I/O pins (GPIO) in GD32L235xx, named PA0 ~ PA15, PB0 ~ PB15, PC0 ~ PC15, PD0 ~ PD6, PD8 ~ PD9, PF0 ~ PF1 to implement logic input/output functions. Each GPIO port has related control and configuration registers to satisfy the requirements of specific applications. The external interrupts on the GPIO pins of the device have related control and configuration registers in the Interrupt/Event Controller Unit (EXTI). The GPIO ports are pin-shared with other alternative functions (AFs) to obtain maximum flexibility on the package pins.

Each of the GPIO pins can be configured by software as output (push-pull or open-drain), input, peripheral alternate function or analog mode. Most of the GPIO pins are shared with digital or analog alternate functions.

### 3.8. CRC calculation unit (CRC)

- Supports 7/8/16/32-bit data input.
- For 7(8)/16/32 bit input data length, the calculation cycles are 1/2/4 AHB clock cycles.
- Free 8-bit register is unrelated to calculation and can be used for any other goals by any other peripheral devices.
- User configurable polynomial value and size.

A cyclic redundancy check (CRC) is an error-detecting code commonly used in digital networks and storage devices to detect accidental changes to raw data. This CRC calculation unit can be used to calculate 7/8/16/32 bit CRC code within user configurable polynomial.

### 3.9. True Random number generator (TRNG)

- About 40 periods of TRNG\_CLK are needed between two consecutive random numbers.
- 32-bit random value seed is generated from analog noise, so the random number is a true random number.

The true random number generator (TRNG) module can generate a 32-bit random value by using continuous analog noise.

### 3.10. Direct memory access controller (DMA)

- 7 channels for DMA controller.
- DMA request from DMAMUX: peripherals (Timers, ADC, DAC, SPIs, I2S, I2Cs, USARTs, CAU and LPUARTs) and request generator.

The flexible general-purpose DMA controllers provide a hardware method of transferring data between peripherals and/or memory without intervention from the CPU, thereby increasing system performance by off-loading the MCU from copying large amounts of data and avoiding frequent interrupts to serve peripherals needing more data or having available data. Three types of access method are supported: peripheral to memory, memory to peripheral, memory to memory.

Each channel is connected to flexible hardware DMA requests. The priorities of DMA channel requests are determined by software configuration and hardware channel number. Transfer size of source and destination are independent and configurable.

### 3.11. DMA request multiplexer (DMAMUX)

- 7 channels for DMAMUX request multiplexer.
- 4 channels for DMAMUX request generator.
- Support 21 trigger inputs and 21 synchronization inputs.

DMAMUX is a transmission scheduler for DMA requests. The DMAMUX request multiplexer is used for routing a DMA request line between the peripherals / generated DMA request (from the DMAMUX request generator) and the DMA controller. Each DMAMUX request multiplexer channel selects a unique DMA request line, unconditionally or synchronously with events from its DMAMUX synchronization inputs. The DMA request is pending until it is served by the DMA controller which generates a DMA acknowledge signal (the DMA request signal is de-asserted).

### 3.12. Analog to digital converter (ADC)

- 12-bit SAR ADC's conversion rate is up to 1.067 MSPS.
- Hardware oversampling ratio adjustable from 2x to 256x improves resolution to 16-bit.
- Input voltage range:  $V_{SS}/V_{SSA}$  to  $V_{DD}/V_{DDA}$ .
- Temperature sensor.
- Single-ended and differential input channels

A 12-bit multi-channel ADC is integrated in the device. It has a total of 20 multiplexed channels: up to 16 external channels, 1 channel for internal temperature sensor ( $V_{SENSE}$ ), 1 channel for internal reference voltage ( $V_{REFINT}$ ), 1 channel for external battery power supply ( $V_{BAT}$ ), and 1 channel for SLCD voltage ( $V_{SLCD}$ ). The input voltage range is between  $V_{SS}/V_{SSA}$

and  $V_{DD}/V_{DDA}$ . An on-chip hardware oversampling scheme improves performance while off-loading the related computational burden from the CPU. The analog watchdog allows the application to detect whether the input voltage goes outside the user-defined higher or lower thresholds. A configurable channel management block can be used to perform conversions in single, continuous, scan or discontinuous mode to support more advanced use.

The ADC can be triggered from the events generated by the general level 0 timers (TIMERx, x=1, 2) and the general level 1 timers (TIMERx, x=8, 11) and the advanced TIMERO and the general level 3 TIMER14 with internal connection. The temperature sensor can be used to generate a voltage that varies linearly with temperature. It is internally connected to the ADC\_IN16 input channel which is used to convert the sensor output voltage in a digital value.

To ensure a high accuracy on ADC, the independent power supply  $V_{DDA}$  is implemented to achieve better performance of analog circuits.  $V_{DDA}$  can be externally connected to  $V_{DD}$  through the external filtering circuit that avoids noise on  $V_{DDA}$ .

### 3.13. Digital to analog converter (DAC)

- One 12-bit DAC with one output channel.
- 8-bit or 12-bit mode in conjunction with the DMA controller.
- Support references from internal 2.5V/2.048V precision reference or external VREFP pin.

The 12-bit buffered DAC is used to generate variable analog outputs. The DAC channels can be triggered by the timer or EXTI with DMA support. The maximum output value of the DAC is  $V_{REFP}$ .

### 3.14. Real time clock (RTC)

- Independent binary-coded decimal (BCD) format timer/counter with five 32-bit backup registers.
- Calendar with sub-second, second, minute, hour, week day, day, month and year automatically correction.
- Alarm function with wake up from deep-sleep and standby mode capability.
- On-the-fly correction for synchronization with master clock. Digital calibration with 0.95 ppm resolution for compensation of quartz crystal inaccuracy.

The real time clock is an independent timer which provides a set of continuously running counters in backup registers to provide a real calendar function, and provides an alarm interrupt or an expected interrupt. It is not reset by a system or power reset, or when the device wakes up from standby mode. In the RTC unit, there are two prescalers used for implementing the calendar and other functions. One prescaler is a 7-bit asynchronous prescaler and the other is a 15-bit synchronous prescaler.

### 3.15. Timers and PWM generation

- Up to six 16-bit general timers (TIMER1, TIMER2, TIMER8, TIMER11, TIMER14, TIMER40), two 16-bit basic timers (TIMER5, TIMER6), one 16-bit advanced timer (TIMER0) and two 16-bit low power timers (LPTIMER0, LPTIMER1).
- Up to 4 independent channels of PWM, output compare or input capture for each general timer and external trigger input.
- Encoder interface controller with two inputs using quadrature decoder.
- 24-bit SysTick timers down counter.
- 2 watchdog timers (free watchdog timer and window watchdog timer).

The LPTIMER0 and LPTIMER1 are 16-bit timers and it is able to keep running in all power modes except for Standby mode with its diversity of clock sources. The LPTIMER provides one PWM out and also supports an encoder interface with two inputs using quadrature decoder.

The advanced timer (TIMER0) can be used as a three-phase PWM multiplexed on 6 channels. It has complementary PWM outputs with programmable dead-time generation. It can also be used as a complete general timer. The 4 independent channels can be used for input capture, output compare, PWM generation (edge- or center- aligned counting modes) and single pulse mode output. If configured as a general 16-bit timer, it has the same functions as the TIMERx timer. It can be synchronized with external signals or to interconnect with other general timers together which have the same architecture and features.

The general timer can be used for a variety of purposes including general time, input signal pulse width measurement or output waveform generation such as a single pulse generation or PWM output, up to 4 independent channels for input capture/output compare. TIMER1 and TIMER2 are based on a 16-bit auto-reload up/down/center-aligned counter and a 16-bit prescaler. TIMER8, TIMER11, TIMER14 and TIMER40 are based on a 16-bit auto-reload up counter and a 16-bit prescaler. The general timer also supports an encoder interface with two inputs using quadrature decoder.

The basic timer TIMER5 and TIMER6, are mainly used as a simple 16-bit time base.

The GD32L235xx have two watchdog peripherals, free watchdog timer and window watchdog timer. They offer a combination of high safety level, flexibility of use and timing accuracy.

The free watchdog timer includes a 12-bit down-counting counter and an 8-stage prescaler. It is clocked from an independent 32 KHz internal RC and as it operates independently of the main clock, it can operate in deep-sleep and standby modes. It can be used either as a watchdog to reset the device when a problem occurs, or as a free-running timer for application timeout management.

The window watchdog is based on a 7-bit down counter that can be set as free-running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from

the main clock. It has an early wakeup interrupt capability and the counter can be frozen in debug mode.

The SysTick timer is dedicated for OS, but could also be used as a standard down counter. The features are shown below:

- A 24-bit down counter.
- Auto reload capability.
- Maskable system interrupt generation when the counter reaches 0.
- Programmable clock source.

### 3.16. Universal synchronous/asynchronous receiver transmitter (USART/UART)

- Maximum speed up to 8 MBits/s for USART0.
- Maximum speed up to 4 MBits/s for USART1, UART3 and UART4.
- Supports both asynchronous and clocked synchronous serial communication modes.
- IrDA SIR encoder and decoder support.
- LIN break generation and detection.
- ISO 7816-3 compliant smart card interface.
- Dual clock domain.
- Wake up from Deep-sleep mode.

The USART (USART0, USART1) and UART (UART3, UART4) are used to translate data between parallel and serial interfaces, provides a flexible full duplex data exchange using synchronous or asynchronous transfer. It is also commonly used for RS-232 standard communication. The USART/UART includes a programmable baud rate generator which is capable of dividing the system clock to produce a dedicated clock for the USART/UART transmitter and receiver. The USART/UART also supports DMA function for high speed data communication.

### 3.17. Universal asynchronous receiver transmitter (LPUART)

- Maximum speed up to 10 MBits/s.
- Supports asynchronous serial communication modes.
- Supports hardware modem operations (CTS/RTS) and RS485 drive.
- Dual clock domain.
- Wake up from Deep-sleep mode.

The Low-power universal Asynchronous Receiver/Transmitter (LPUART) provides a flexible serial data exchange interface with a limited power consumption. LPUART can perform asynchronous serial communication even with low power consumption. Data frames can be transferred in full duplex or half duplex mode, asynchronously through this interface. A

programmable baud rate generator divides the clock to produce a dedicated wide range baudrate clock for the LPUART transmitter and receiver.

### 3.18. Inter-integrated circuit (I2C)

- Support both master and slave mode with a frequency up to 1 MHz (Fast mode plus).
- Provide arbitration function, optional PEC (packet error checking) generation and checking.
- Supports 7-bit and 10-bit addressing mode and general call addressing mode.
- Multiple 7-bit slave addresses (2 addresses with configurable mask).
- SMBus 3.0 and PMBus 1.3 compatible.
- Wakeup from Deep-sleep / Deep-sleep1 / Deep-sleep2 mode on I2C address match.

The I2C interface is an internal circuit allowing communication with an external I2C interface which is an industry standard two-line serial interface used for connection to external hardware. These two serial lines are known as a serial data line (SDA) and a serial clock line (SCL). The I2C module provides different data transfer rates: up to 100 KHz in standard mode, up to 400 KHz in the fast mode and up to 1 MHz in the fast mode plus. The I2C module also has an arbitration detect function to prevent the situation where more than one master attempts to transmit data to the I2C bus at the same time. A CRC-8 calculator is also provided in I2C interface to perform packet error checking for I2C data.

### 3.19. Serial peripheral interface (SPI)

- Support both master and slave mode.
- Hardware CRC calculation and transmit automatic CRC error checking.
- Separate transmit and receive 32-bit FIFO with DMA capability (only in SPI0).
- Data frame size can be 4 to 16 bits (only in SPI0).
- Quad-SPI configuration available in master mode (only in SPI0).

The SPI interface uses 4 pins, among which are the serial data input and output lines (MISO & MOSI), the clock line (SCK) and the slave select line (NSS). All SPIs can be served by the DMA controller. The SPI interface may be used for a variety of purposes, including simplex synchronous transfers on two lines with a possible bidirectional data line or reliable communication using CRC checking. Quad-SPI master mode is also supported in SPI0.

### 3.20. Inter-IC sound (I2S)

- Sampling frequency from 8 KHz to 192 KHz.
- Support either master or slave mode.

The Inter-IC sound (I2S) bus provides a standard communication interface for digital audio applications by 4-wire serial lines. GD32L235xx contain an I2S-bus interface that can be

operated with 16/32-bit resolution in master or slave mode, pin multiplexed with SPI1. The audio sampling frequency from 8 KHz to 192 KHz is supported.

### 3.21. Cryptographic acceleration Unit (CAU)

- Supports DES, TDES or AES (128, 192, or 256) algorithms.
- DES / TDES supports Electronic codebook (ECB) or Cipher block chaining (CBC) mode.
- AES supports 128bits-key, 192bits-key or 256 bits-key.
- AES supports Electronic codebook (ECB), Cipher block chaining (CBC) mode, Counter mode (CTR) mode, Galois / counter mode (GCM), Galois message authentication code mode (GMAC), Counter with CBC-MAC (CCM), Cipher Feedback mode (CFB) and Output Feedback mode (OFB).
- DMA transfer for incoming and outgoing data is supported.

The Cryptographic Acceleration Unit supports acceleration of DES, TDES or AES (128, 192, or 256) algorithms. The DES / TDES supports Electronic codebook (ECB) or Cipher block chaining (CBC) mode. The AES supports Electronic codebook (ECB), Cipher block chaining (CBC) mode, Counter mode (CTR) mode, Galois/counter mode (GCM), Galois message authentication code mode (GMAC), Counter with CBC-MAC (CCM), Cipher Feedback mode (CFB) and Output Feedback mode (OFB).

### 3.22. Segment LCD controller (SLCD)

- Configurable frame frequency.
- Blinking of individual segments or all segments.
- Supports Static, 1/2, 1/3, 1/4, 1/6 and 1/8 duty.
- Supports 1/2, 1/3 and 1/4 bias.
- Double buffer up to 8x32 bits registers to store SLCD\_DATAx.
- The contrast can also be adjusted by configuring dead time.

The SLCD controller directly drives LCD displays by creating the AC segment and common voltage signals automatically. It can drive the monochrome passive liquid crystal display (LCD) which composed of a plurality of segments (pixels or complete symbols) that can be converted to visible or invisible. The SLCD controller can support up to 32 segments and 8 commons.

### 3.23. Comparators (CMP)

- Two fast rail-to-rail low-power comparators with software configurable.
- Programmable reference voltage (internal or external I/O).

Two Comparators (CMP) is implemented within the device. It can wake up from deep-sleep mode to generate interrupts and also can be combined as a window comparator. The internal

voltage reference is also connected to ADC\_IN17 input channel of the ADC.

### 3.24. Controller area network (CAN)

- CAN2.0B interface with communication frequency up to 1 Mbit/s
- Internal main PLL for CAN CLK compliantly

Controller area network (CAN) is a method for enabling serial communication in field bus. The CAN protocol has been used extensively in industrial automation and automotive applications. It can receive and transmit standard frames with 11-bit identifiers as well as extended frames with 29-bit identifiers. The CAN has three mailboxes for transmission and two FIFOs of three message deep for reception. It also provides 28 scalable/configurable identifier filter banks for selecting the incoming messages needed and discarding the others.

### 3.25. Universal serial bus full-speed device interface (USB)

- USB 2.0 full-speed device controller.
- Support USB 2.0 Link Power Management.
- Dedicated 512-byte SRAM used for data packet buffer.
- Support embedded pull-up on the DP line.
- Integrated USB PHY.

The Universal Serial Bus full-speed device interface (USB) module contains a full-speed internal USB PHY and no more external PHY chip is needed. USB supports all the four types of transfer (control, bulk, interrupt and isochronous) defined in USB 2.0 protocol. USB supports 8 USB bidirectional endpoints that can be individually configured.

### 3.26. Debug mode

- Serial wire debug port (SW-DP).

Debug capabilities can be accessed by a debug tool via Serial Wire (SW - Debug Port).

### 3.27. Package and operation temperature

- LQFP64 (GD32L235RxT6), LQFP64 (GD32L235RxT7), LQFP48 (GD32L235CxT6), LQFP48 (GD32L235CxT7), QFN48 (GD32L235CxO6), LQFP32 (GD32L235KxT6), QFN32 (GD32L235KxQ6), QFN32 (GD32L235KxQ7), QFN32 (GD32L235KxQ6P) and WLCPS25 (GD32L235ExY6).
- Operation temperature range: -40°C to +85°C (industrial level) for grade 6 devices, and -40°C to +105°C (industrial level) for grade 7 devices.

## 4 Electrical characteristics

To better understand this chapter, read the following before moving on to the rest of this chapter.

- $T_A$  (Ambient temperature) tested condition.
- $T_J$  (Junction temperature) tested condition.
- Value guaranteed by design, not 100% tested in production indicates that the value is derived from simulation of IC designers.
- Value guaranteed by characterization, not 100% tested in production indicates that the value is derived from random test.
- Value guaranteed by sample, not 100% tested in production indicates that the value is derived from a small number of sample tests.
- Unless otherwise specified, all values given for  $V_{DD} = V_{DDA} = 3.3\text{ V}$ ,  $T_A = 25\text{ }^\circ\text{C}$ .
- The devices will be damaged or work abnormally if the electrical parameters beyond the range of maximum and minimum values.

See the following table for some abbreviation terms and their descriptions in this chapter.

**Table 4-1. Abbreviations**

Acronym	Description
ADC	Analog-to-Digital Converter
AHB	Advanced High-performance Bus
APB	Advanced Peripheral Bus
CAN	Controller Area Network
DAC	Digital-to-Analog Converter
DMA	Direct Memory Access
GPIO	General Purpose Input/Output
PLL	Phase-Locked Loop
USB	Universal Serial Bus
SPI	Serial Peripheral Interface
SLCD	Segment LCD Controller

## 4.1 Absolute maximum ratings

The maximum ratings are the limits to which the device can be subjected without permanently damaging the device. Note that the device is not guaranteed to operate properly beyond the maximum ratings. Exposure to the absolute maximum rating conditions for extended periods may affect device reliability.

**Table 4-2. Absolute maximum ratings** <sup>(1)(4)</sup>

Symbol	Parameter	Min	Max	Unit
$V_{DD}$	External voltage range <sup>(2)</sup>	$V_{SS} - 0.3$	$V_{SS} + 3.63$	V
$V_{DDA}$	External analog supply voltage	$V_{SSA} - 0.3$	$V_{SSA} + 3.63$	V
$V_{BAT}$	External battery supply voltage	$V_{SS} - 0.3$	$V_{SS} + 3.63$	V
$V_{IN}$	Input voltage on 5V tolerant pin <sup>(3)</sup>	$V_{SS} - 0.3$	$V_{DD} + 3.63$	V

	Power dissipation at $T_A = 85^\circ\text{C}$ of WLCSP25 <sup>(5)</sup>	—	570	
$T_{STG}$	Storage temperature range	-65	+150	°C
$T_J$	Maximum junction temperature	—	+125	°C

(1) Value guaranteed by design, not 100% tested in production.

(2) All main power and ground pins should be connected to an external power source within the allowable range.

(3)  $V_{IN}$  maximum value cannot exceed 5.5 V.

(4) It is recommended that  $V_{DD}$  and  $V_{DDA}$  are powered by the same source. The maximum difference between  $V_{DD}$  and  $V_{DDA}$  does not exceed 300 mV during power-up and operation.

(5) For grade 6 devices, the parameter of  $T_A=85^\circ\text{C}$ , For grade 7 devices, the parameter of  $T_A=105^\circ\text{C}$ .

## 4.2 Operating conditions characteristics

**Table 4-3. DC operating conditions <sup>(1)</sup>**

Symbol	Parameter	Conditions	Min <sup>(1)</sup>	Typ	Max <sup>(1)</sup>	Unit

Symbol	Parameter	Conditions	Typ	Unit
$t_{ST}$	Start-up time	Clock source from HXTAL	1.62	ms
		Clock source from IRC16M	49.7	us

- (1) Based on sample, not tested in production.
- (2) After power-up, the start-up time is the time between the rising edge of NRST high and the first I/O instruction conversion in SystemInit function.
- (3) PLL is off.

**Table 4-7. Power saving mode wakeup timings characteristics <sup>(1)(2)</sup>**

Symbol	Parameter	Typ	Unit
$t_{Sleep}$	Wakeup from Sleep mode	0.66	$\mu s$
$t_{Deep-sleep}$	Wakeup from Deep-sleep mode (NPLDO in normal driver mode)	1.50	
	Wakeup from Deep-sleep mode (NPLDO in low driver mode)	1.50	
	Wakeup from Deep-sleep 1 mode	5.53	
	Wakeup from Deep-sleep 2 mode	40.10	
$t_{Standby}$	Wakeup from Standby mode	53.06	

- (1) Value guaranteed by sample, not 100% tested in production.
- (2) The wakeup time is measured from the wakeup event to the point at which the application code reads the first instruction under the below conditions:  $V_{DD} = V_{DDA} = 3.3 V$ , IRC16M = System clock = 16MHz.

## 4.3 Power consumption

The power consumption is measured as described in [Figure 4 2. Power consumption measurement diagram](#). The current consumption values are derived from the tests powered by  $V_{DD} = V_{DDA}$  except BKP\_ONLY mode, while the current is  $I_{SUM}$ . In BKP\_ONLY mode, the RTC unit and LXTAL oscillator are powered by the  $V_{BAT}$ , while the current is  $I_{BAT}$ .

## 5.8 Thermal characteristics

Thermal resistance is used to characterize the thermal performance of the package device, which is represented by the Greek letter “ $\theta$ ”. For semiconductor devices, thermal resistance represents the steady-state temperature rise of the chip junction due to the heat dissipated on the chip surface.

$\theta_{JA}$ : Thermal resistance, junction-to-ambient.

$\theta_{JB}$ : Thermal resistance, junction-to-board.

$\theta_{JC}$ : Thermal resistance, junction-to-case.

$\psi_{JB}$ : Thermal characterization parameter, junction-to-board.

$\psi_{JT}$ : Thermal characterization parameter, junction-to-top center.

$$\theta_{JA}=(T_J-T_A)/P_D \quad (5-1)$$

$$\theta_{JB}=(T_J-T_B)/P_D \quad (5-2)$$

$$\theta_{JC}=(T_J-T_C)/P_D \quad (5-3)$$

Where,  $T_J$  = Junction temperature.

$T_A$  = Ambient temperature

$T_B$  = Board temperature

$T_C$  = Case temperature which is monitoring on package surface

$P_D$  = Total power dissipation

$\theta_{JA}$  represents the resistance of the heat flows from the heating junction to ambient air. It is an indicator of package heat dissipation capability. Lower  $\theta_{JA}$  can be considerate as better overall thermal performance.  $\theta_{JA}$  is generally used to estimate junction temperature.

$\theta_{JB}$  is used to measure the heat flow resistance between the chip surface and the PCB board.

$\theta_{JC}$  represents the thermal resistance between the chip surface and the package top case.  $\theta_{JC}$  is mainly used to estimate the heat dissipation of the system (using heat sink or other heat dissipation methods outside the device package).

## 7 Revision history

**Table 7-1. Revision history**

Revision No.	Description	Date
1.0	Initial Release	Mar. 29, 2024
1.1	Update the pin number order of GD32L235KxxxP in <b><u>Figure 2 8. GD32L235KxxxP QFN32 VREFP pinouts</u></b> and <b><u>Table 2-10. GD32L235KxxxP QFN32 VREFP pin definitions.</u></b>	Apr. 8, 2024
1.2	1. Add GD32L235CBT7 information in <b><u>Table 2-1 \ Table 4-2 \ Table 4-23 \ Table 4-24 \ Table 4-25 \ Table 4-27.</u></b> 2. Add coplanarity information for all POD diagram. 3. Update PA8 pin definition.	June. 13, 2024
1.3	1. Add GD32L235K8Q7 information in <b><u>Table 2-1 \ 3.27 Package and operation temperature \ 6 Ordering information \ 4.1 Absolute maximum ratings .</u></b> 2. Add the comment of VREFP of <b><u>Table 4 33. ADC characteristics.</u></b> 3. Add Min and Max parameters of <b><u>Table 4-31. Output voltage characteristics for all I/Os except PC13, PC14, PC15.</u></b>	Nov. 8, 2024
1.4	1. Add GD32L235RBT7 information in <b><u>Table 2-1 \ 3.27 Package and operation temperature \ 6 Ordering information.</u></b> 2. Change “DAC_OUT” to “DAC0_OUT0” in <b><u>2.6. Pin definitions.</u></b> 3. Remove the maximum rate in the description of SPI in <b><u>3.19. Serial peripheral interface (SPI)</u></b> (refer to <b><u>Table 4 45. Standard SPI characteristics</u></b> if needed). 4. Modify the description of the maximum rate for USART/UART in <b><u>3.16. Universal synchronous/asynchronous receiver transmitter (USART/UART).</u></b> 5. Modify the description of the maximum rate for LPUART in <b><u>3.17. Universal asynchronous receiver transmitter (LPUART).</u></b> 6. Add Drift <sub>IRC16M</sub> , Drift <sub>IRC48M</sub> , and f <sub>IRC32K</sub> data under the conditions of VDD = VDDA = 3.3 V, TA = -40 °C ~ +105 °C in <b><u>Table 4 23. High speed internal clock (IRC16M) characteristics \ Table 4 24. High speed internal clock (IRC48M) characteristics \ Table 4 25. Low speed internal clock (IRC32K) characteristics.</u></b>	Jan. 2, 2025
